

η is anchored two ways that agree to $\sim 1\%$
CMB (recombination) and BBN (nucleosynthesis)

Spin is local; chirality is inherited
(do not conflate them)

quantity	inherited?	set by
chirality sign (matter/antimatter)	YES	the OG seed's vorticity sign
spin magnitude	no	progenitor hole's local collapse
spin axis	no	progenitor hole's Kerr axis
η magnitude	yes (debris)	parent meal, extrusion (Ch.4)

*Observable from our spin: a preferred AXIS
(CMB axis-of-evil = galaxy-spin handedness)*
