

THE DILUTE SUPRAVERSE

true to scale: the void weighs $\rho_{\Lambda} \approx 6\text{e-}27 \text{ kg/m}^3$ (~ 3 protons/ m^3), so it occupies real space -- universes are isolated flat discs (slightly oblate from spin), not polygons; the void dominates, and they sit $\sim e^{1/4}$ horizons apart ($l \sim 10^{84}$).
