

Particle-scale genesis: torsitons crystallising from the cooling chiral fluid (2D baby-Skyrme quench)

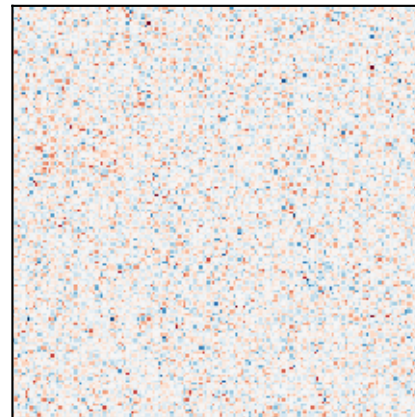

hot tally
(disordered)
 $T=0.83$

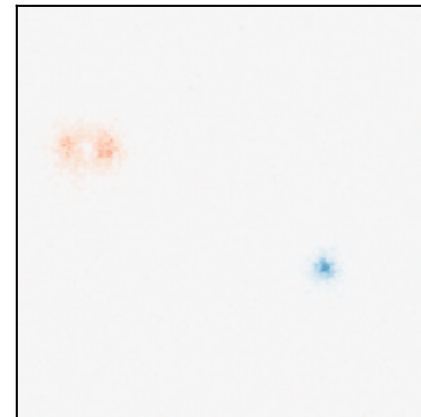

cooling
(domains)
 $T=0.62$

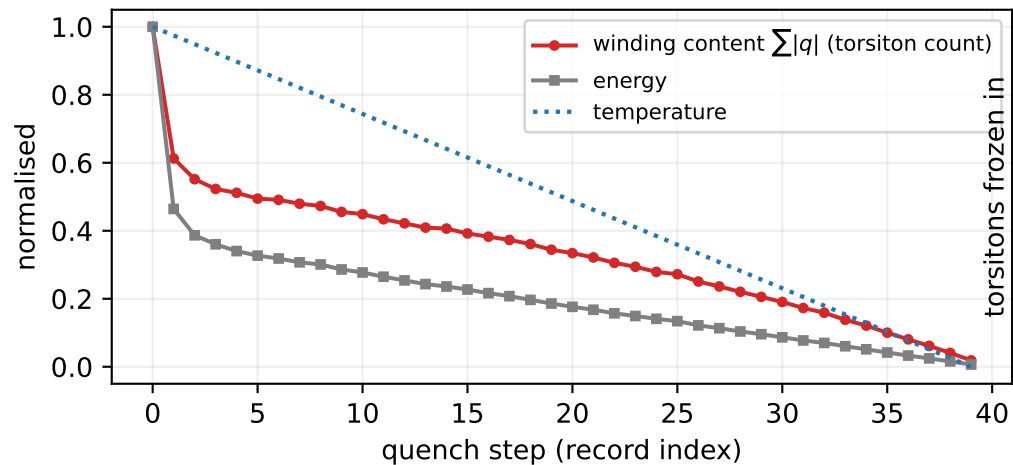

condensing
(knots forming)
 $T=0.35$

frozen relic
(torsitons)
 $T=0.00$

the fluid condenses: energy & winding fall, a relic set freezes

Kibble--Zurek: faster quench, more torsitons
