

W, Z, Higgs in the composite/walking reading: gauge-boson masses clean (0.4%, $\rho = 1$); Higgs light because it walks (exact owed, L3)

W, Z from the condensate scale (within 0.4%)
custodial $\rho = 1$: $m_W = m_Z \cos \theta_W$

The Higgs as a composite scalar (bracketed)
observed sits at the light edge -> walking
