

3D genesis: baryons (torsitons) crystallising from the cooling chiral fluid (SU(2) Skyrme quench)

hot tally
(disordered)
 $T=0.78$

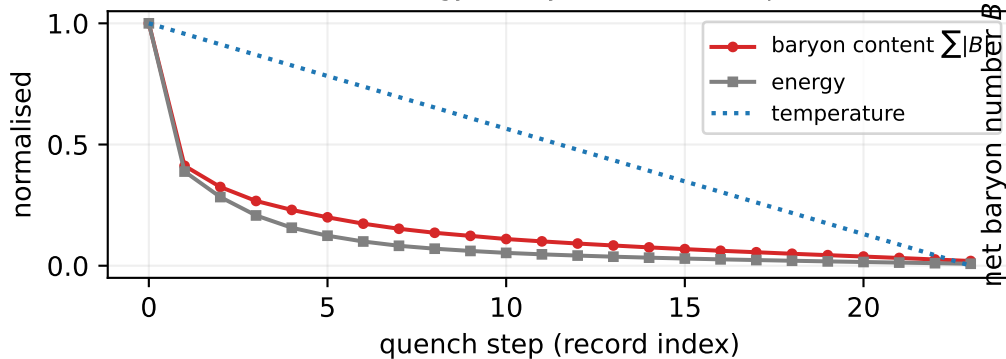

cooling
(domains)
 $T=0.55$

condensing
(baryons forming)
 $T=0.30$

frozen relic
(baryons)
 $T=0.00$

the fluid condenses: energy & baryon content collapse, a relic freezes

net baryon number (topologically conserved through the quench)
